NECC Workshop [23-05-2018]

docker

kubernetes

“It works on my computer!!!”

Who never said that?

“Docker enables true
independence between
applications and infrastructure”

(hint)

<https://www.docker.com/what-docker>

**Docker
packages
applications in
portable
“containers”
that can run
“anywhere”**

Kubernetes manages containerized applications

\$ docker images

<https://hub.docker.com/search/?q=python>

\$ docker pull IMAGE

```
$ docker run IMAGE  
$ docker run IMAGE CMD  
$ docker ps
```

Dockerfile

Build

Image

```
$ docker build -f FILE -t IMAGE DIR
```

FROM python:alpine

CMD python --version

Dockerfile

```
version: "3"
```

```
services:
```

```
  app-name:
```

```
    build: .
```

```
docker-compose.yml
```

“Compose is a tool for **defining**
and **running** multi-container
Docker applications”

<https://docs.docker.com/compose/overview/>

End of Part 1 (of 2)

[overview](#) // [docs](#) // [community](#) // [extensions](#) // [donate](#)

Flask is a microframework for Python based on Werkzeug, Jinja 2 and good intentions. And before you ask: It's [BSD licensed](#)!

Flask is Fun

Latest Version: [1.0.2](#)

```
from flask import Flask
app = Flask(__name__)

@app.route("/")
def hello():
    return "Hello World!"
```

And Easy to Setup

```
$ pip install Flask
```

<http://flask.pocoo.org/>

(google “flask python”)

Kubernetes 101

Kubectl CLI and Pods

For Kubernetes 101, we will cover kubectl, Pods, Volumes, and multiple containers.

You need to have a Kubernetes cluster, and the kubectl command-line tool must be configured to communicate with your cluster.

If you do not already have a cluster, you can create one by using [Minikube](#), or you can use one of these Kubernetes playgrounds:

- [Katacoda](#)
- [Play with Kubernetes](#)

To check the version, enter `kubectl version`.

In order for the kubectl usage examples to work, make sure you have an example directory locally, either from [a release](#) or the latest `.yaml` files located [here](#).

- [Kubectl CLI and Pods](#)
- [Kubectl CLI](#)
- [Pods](#)
 - [Pod Definition](#)
 - [Pod Management](#)
 - [Volumes](#)
 - [Volume Types](#)
 - [Multiple Containers](#)
- [What's Next?](#)

(google “k8s 101”)

Type LoadBalancer

On cloud providers which support external load balancers, setting the `type` field to `"LoadBalancer"` will provision a load balancer for your `Service`. The actual creation of the load balancer happens asynchronously, and information about the provisioned balancer will be published in the `Service`'s `status.loadBalancer` field. For example:

```
kind: Service
apiVersion: v1
metadata:
  name: my-service
spec:
  selector:
    app: MyApp
  ports:
  - protocol: TCP
    port: 80
    targetPort: 9376
  clusterIP: 10.0.171.239
  loadBalancerIP: 78.11.24.19
  type: LoadBalancer
status:
  loadBalancer:
    ingress:
    - ip: 146.148.47.155
```

[https://kubernetes.io/docs/concepts/service
s-networking/service/#type-loadbalancer](https://kubernetes.io/docs/concepts/services-networking/service/#type-loadbalancer)

(google “k8s services”)

Creating a Deployment

The following is an example of a Deployment. It creates a ReplicaSet to bring up three `nginx` Pods:

`nginx-deployment.yaml` [docs/concepts/workloads/controllers/](https://kubernetes.io/docs/concepts/workloads/controllers/)

```
apiVersion: apps/v1
kind: Deployment
metadata:
  name: nginx-deployment
  labels:
    app: nginx
spec:
  replicas: 3
  selector:
    matchLabels:
      app: nginx
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
        - name: nginx
          image: nginx:1.7.9
          ports:
            - containerPort: 80
```

<https://kubernetes.io/docs/concepts/workloads/controllers/deployment/>

(google “k8s
deployments”)

Thank you for listening!
